

Why Are RAM Prices Skyrocketing?

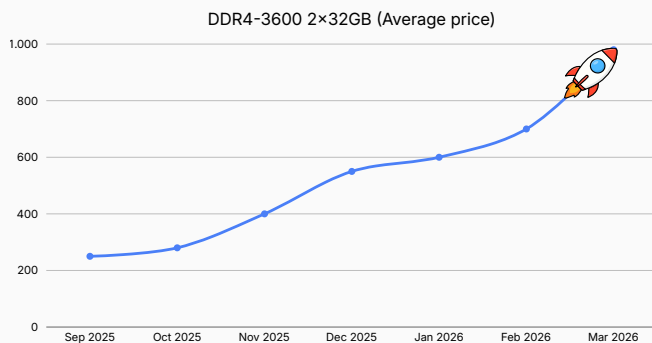

As you, the gamer, may already know, RAM prices are skyrocketing, but why...?

Three Companies dominate memory production

What makes it worse is that Micron, a company that once dominated the memory market, decided to exit the Crucial consumer business.

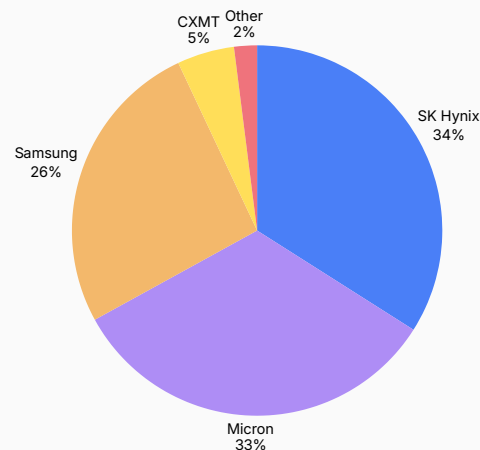

Salvation?

On March 24, 2026, Google announced a new technology called TurboQuant, claiming that it can make AI more memory-efficient and faster during inference. This caused Micron, Samsung, and SK hynix stock prices, as well as RAM prices, to drop simultaneously.

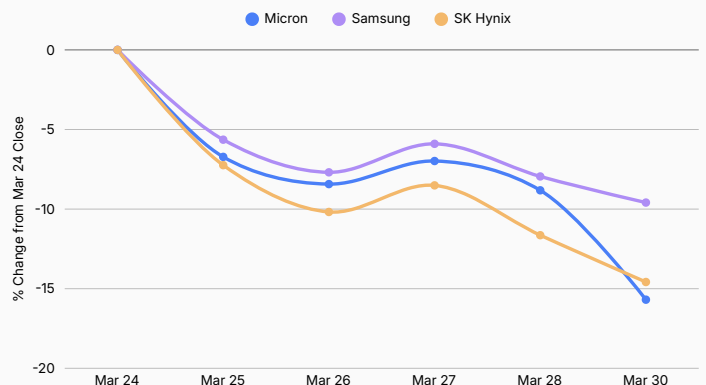

The Short Memory

DRAM suppliers' inventory collapsed from 15 weeks of inventory in late 2024 to extremely tight levels by October 2025 due to demand from the AI revolution.

Result

As a result, RAM prices have been skyrocketing since the beginning of September 2025.

Is the RAM price issue finally over? Only time will tell...
