

Finding a Personal Story: Jeranth, Amanda, Tom, Sajeela, Jin, David

Based on exercises created by <https://dataculturegroup.org/>

Some stories are interesting because they connect to your real life. Personalizing the story creates a connection to the real world meaning of the data and can be a powerful type of story for small audiences. Stories about someone's personal experiences can make the data seem more real.

The data says...

- *Lakeview has the highest % of obesity 42%*
- *Beatrice south have highest 87 life expectancy in Female, Amberlee has the highest male life expectancy of 86.49*
- *Central Ajax (A4) has the largest gap between male and female life expectancy (9.65 years)*
- *Oshawa Northwest has the highest % of newcomers (likely due to Durham College/Ontario Tech)*
- *Downtown Oshawa has the highest smoking rate and the lowest male and female life expectancy.*
- *In Oshawa the differences between the self rated health and physical health reported showcase that regions that have higher levels of obesity and smoking rate their health lower than regions that have lesser amounts.*
- *Prolonged smoking and obesity in Oshawa has a negative impact on the children born in the region. Specifically downtown Oshawa.*

This connects to real people because...

- *I used to attend my language classes in DT Oshawa, the drug addicted people make that place unsafe and unhealthy and I withdrew from the program because it affected my health a lot.*
- *My uncle lives in DT Oshawa and he is affected by the smoking smell and is not able to walk outside in summer to enjoy the weather, which really affect his health.*
-

We want to tell this story because...

- *We want to tell this story of the lower life expectancy of Downtown Oshawa is related to drug consumption and smoking which creates an unsafe environment for the everyday individual who is not partaking in the substances.*
- *We want to tell this story because DT Oshawa is not safe for elderly people and makes the environment very dangerous for elderly people.*
- *We want to tell this story as regions with high amounts of smoking and obesity affect the health of the children in Canada.*

We want to tell this story as regions with high amounts of smoking and obesity affect the health of the children in Canada.

Percentage of senior kindergarten (SK) children vulnerable in physical health and well-being as measured by the Early Development Instrument (EDI).

Physical health includes gross and fine motor skills (e.g. holding a pencil, running on the playground), motor coordination, and having adequate energy levels for classroom activities. Teachers complete the EDI for all students to measure whether SK children are developmentally ready to enter Grade 1. Children with special needs and those who had been in a class for less than one month at the time of the survey are excluded.
